## Evolution in Science – Evolution in Health and Disease – Evolution in my Research

The following papers are a **trilogy** of my scientific work from November 2007 to January 2015, which reflect the progress in science considering new findings based on molecular biology as well as on social and psychological outcomes.

The Human Genome Project, Epigenetic, Systems Biology as well as Anthropology and the Humanities now contribute to a better understanding of our human world.

My three papers might reflect the progress in these topics in more or less one decade.

1. Reconciliation between Pure Scientists and AIDS-Dissidents: *Could an ancient retrovirus, RNA-interference and stress be the answer to the divergent opinions?*
2. **Humans In Variety / Adapted Immune Developmental Symbiosis**
3. **GENE OR VIRUS IN HEALTH AND DISEASE: IT'S ALL ABOUT SELF AND NON-SELF**

My aim is to contribute – along with so many other people – to a better future for our world and the whole living system.
